

# UNDERSTANDING CHILDHOOD LIVER DISEASE

## WHAT IS CHILDHOOD LIVER DISEASE?

Any condition that disrupts the function of the liver in children.

## WHAT PUTS A CHILD AT RISK?

Family history

Viral hepatitis transmission

Autoimmune conditions

## DID YOU KNOW?

- Childhood liver disease is often diagnosed late as early symptoms are hard to detect.<sup>1</sup>
- If left undiagnosed, childhood liver disease can lead to serious complications.<sup>2</sup>
- Many childhood liver diseases are genetic – it is a common misconception that childhood liver disease is alcohol-related.

## HOW MANY CHILDREN HAVE A CHILDHOOD LIVER DISEASE?

Prevalence is increasing, with up to 1 in 10 children\* across Europe being affected.<sup>3</sup>

\*This includes infants, school children and adolescents

# 1 in 10

## WHAT SIGNS SHOULD YOU LOOK OUT FOR?

One sign of childhood liver disease is newborn jaundice – when a baby's skin and the whites of their eyes turn yellow. If a newborn baby has jaundice for more than 2 weeks you should consult your doctor, as it could be a sign of childhood liver disease or another serious condition.

You should visit your doctor if your child displays a combination of the following (this does not necessarily mean your child has childhood liver disease but a check-up is important):

- Dark urine & pale stools
- Regular pain or swelling in the abdomen
- Itchy skin
- Loss of appetite
- Bleeding and/or bruising easily
- Poor growth
