SCAR CARE

What to do at home
Daily care

Washing
The patient can have a shower as of: ________________________
The patient can have a bath as of: ________________________

Massage
Starting: ________________________

Use an ointment or barrier cream to rub the skin along the scar for 3 minutes, two or three times a day for several weeks (see diagram below).

Start by rubbing the skin slowly, softly and lightly, then increase the pressure (after about 4 weeks). The scar should whiten as you rub, then return to its earlier colour.

A scar can change shape for up to 2 years, until it turns white. As long as it is red it is still healing and the massages should be continued. Scar tissue is always more fragile than normal skin.

INFO
Your child was treated at the wound clinic following surgery or an accident. This brochure explains what you have to do to make sure the scar heals well.
**Compression**

- No
- Yes

As of: 

Cover the scar with medical adhesive tape for at least 3 months. Should the scar redden, thicken or swell, you should consult a surgeon to use another method. The health-care team can see your child again if necessary.

**Sun screen**

It is recommended not to expose scars to the sun for 18 months or to use sun block and apply it frequently.

When you buy a sunscreen for your child, pay careful attention to the sun protection factor (SPF 50) and choose a hypoallergenic mineral screen.

Whenever possible, protect scars with a cap or UV-protective clothing (sold in department stores and sportswear shops).

**What to look out for**

Whether or not your child has a fever, you should immediately consult a doctor if his or her scar:
- becomes red
- swells
- oozes
- causes pain.

**DID YOU KNOW?**

The sun’s rays can darken the scar until the healing process is complete. The darker colour will remain visible for life. This is why recent scars should not be exposed to the sun or should be well protected.
