

ISAM meeting  
2010

THE INTERNATIONAL SOCIETY OF ADDICTION MEDICINE | 12th ANNUAL MEETING

MILAN OCTOBER  
3 | 4 | 5 | 6 | 7

# Validation of the French version of the Alcohol, Smoking and Substance Involvement Screening Test (ASSIST)

*Riaz Khan, Barbara Broers*

*Audrey Nallet, Yasser Khazaal, Gabriel Thorens, Sophia  
Achab-Arigo, Vadimir Poznyak, Alexandra Fleischmann, Anne  
Chatton, Daniele Zullino*

# Disclosures

## Disclosures

- The authors have nothing to disclose. The project was funded by the Quality Programme of the Geneva University Hospitals

## Unlabeled/Unapproved Uses Disclosure

- None

# Outline

- WHO ASSIST Project
- ASSIST Questionnaire
- Results of validation study
- Prevalence of problematic substance use in different settings
- Conclusions and recommendations

# Introduction: WHO ASSIST & Phases

- Phase I : Test-retest reliability studies & feasibility study (1997-1999) 12 items selected, 8 retained for the short version
- Phase II: Validation studies between 2000-2002, development of brief intervention and orientation procedures (7 sites)
- Phase III: RCT's evaluating efficacy of ASSIST coupled with brief intervention for illicit substances use
- Phase IV (ongoing): Summarize current status of interventions in the world based on ASSIST. Dissemination of the Assist package: training for the trainers, computerized version, brief ASSIST paper version(2-4 questions)

# ASSIST Questionnaire

Question 1: Life time prevalence of consumption of substances

Question 2: Frequency of consumption in the last 3 months

Questions 3-5: Relate to substance consumption in the last 3 months

Question 3: Explores the compulsion to consume in the last 3 months

# ASSIST Questionnaire

Question 4: Informs on personal and social health along with financial or legal status in the previous 3 months.

Indicateur of »harmful use »

Question 5: Explores failure of subject to fulfill role obligations

Questions 6-8: Explore life-time and recent problems, Concerns of the entourage, previous attempts to control substance consumption, life-time and actual injectable habits.

# ASSIST in different languages

ASSIST validated in: English, Arabic, Chinese, Farsi, German, Hindi, Portuguese, Spanish

For the development of the French version:

- translation-backtranslation
- panel discussion
- test phase

Cut-off scores:

- 0-3 no intervention (alcohol 0-9)
- 4-26 brief intervention (alcohol 11-26)
- 27 + more intensive treatment

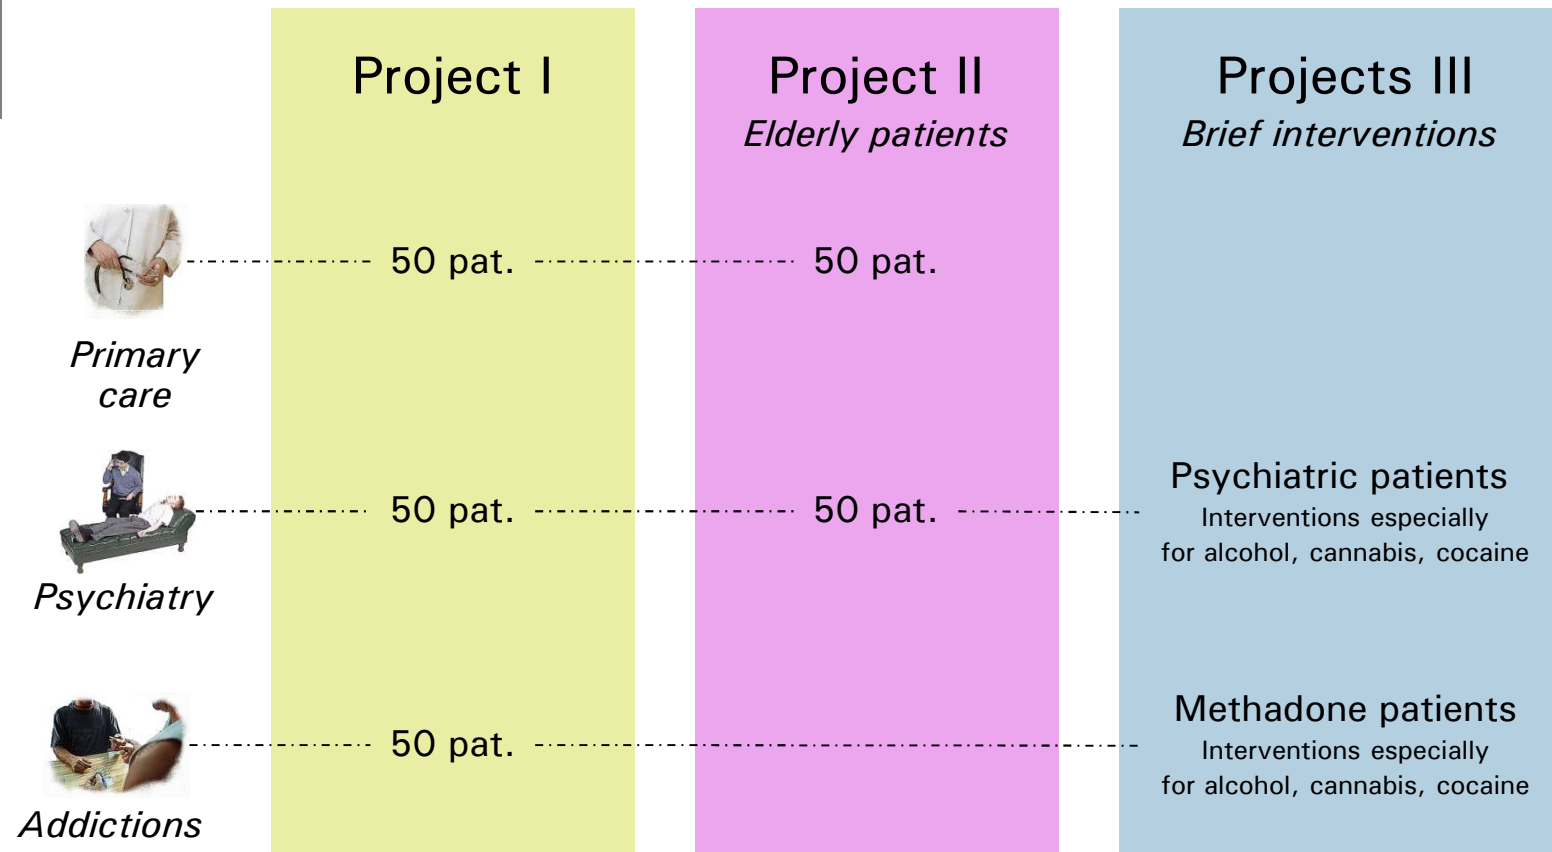

# ASSIST: 8 questions

- Alcohol
- Tobacco
- Cannabis
- Cocaine
- Amphetamines
- Inhalants
- Sedatives
- Hallucinogens
- Opiates & other drugs

Can be answered by most subjects in a primary health care setting in less than five minutes

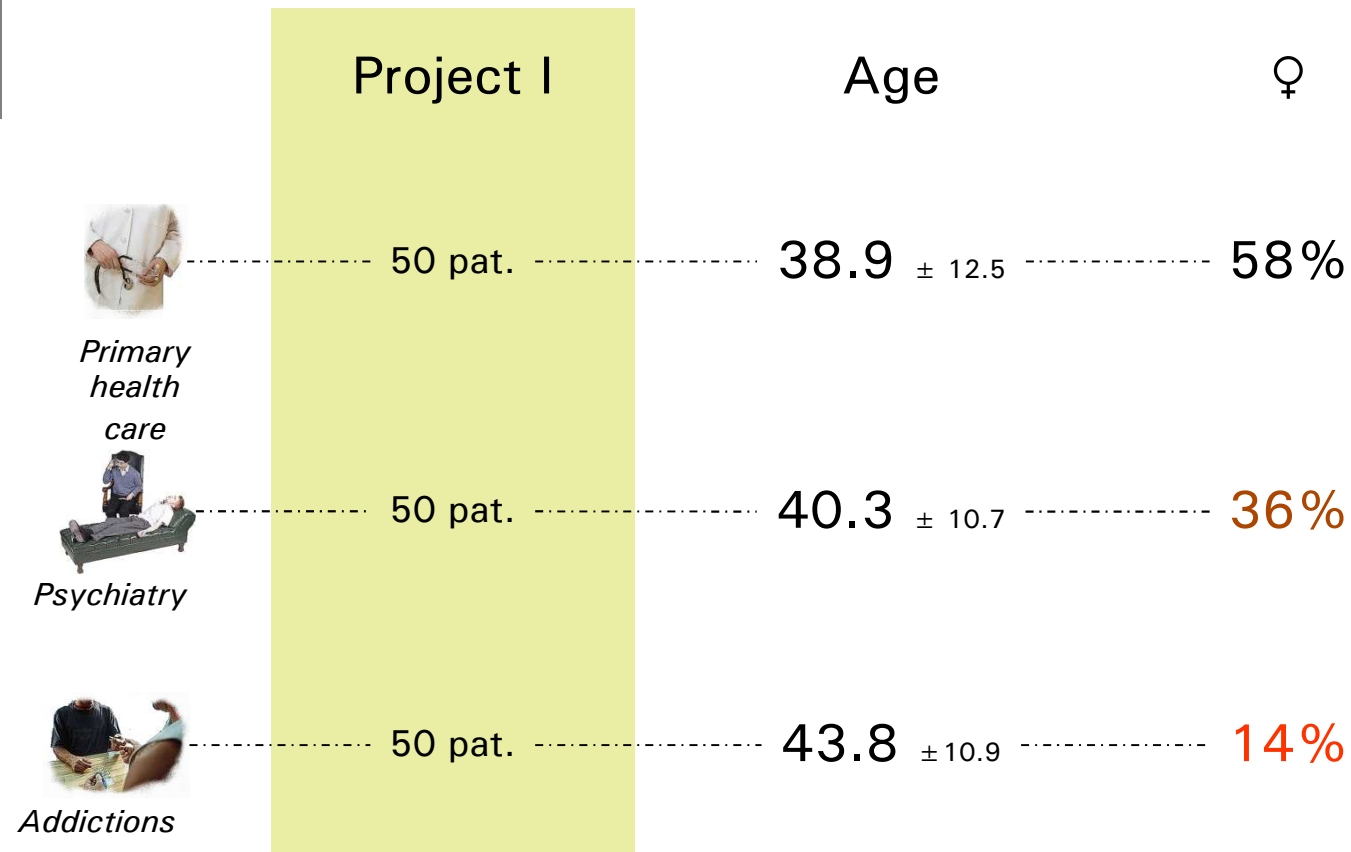

# ASSIST – Geneva Projects

# Validation of the French version: methods

- In clinical populations with low to high prevalence of substance use
- Gold standards:
  - Addiction Severity Index (ASI)
  - MINI International Neuropsychiatric Interview (MINI-Plus)
  - Alcohol Use Disorders Identification Test (AUDIT)
  - Revised Fagerstrom Tolerance Questionnaire-Smoking (RTQ)

## Age and Gender distribution

# Results

## □ Concurrent validity

- Evidenced by significant positive correlations  
Obtained between ASSIST scores and  
ASI, MINI-Plus, AUDIT and RTQ
- ASSIST-specific substance involvement scores were  
significantly greater for those participants diagnosed  
with abuse or dependence on the MINI-Plus

# Results

## □ Construct validity

- Internal consistency: ASSIST showed high internal consistency for the Global continuum substance risk score or the total substance involvement score (TSI) with Cronbach's  $\alpha$  coefficient of 0.91 ( $p < 0.0005$ ).
- All ASSIST specific substance scores showed good internal consistency with Cronbach's  $\alpha$  coefficient ranging from 0.74 to 0.93., except for cannabis abuse ( $p = 0.06$ )

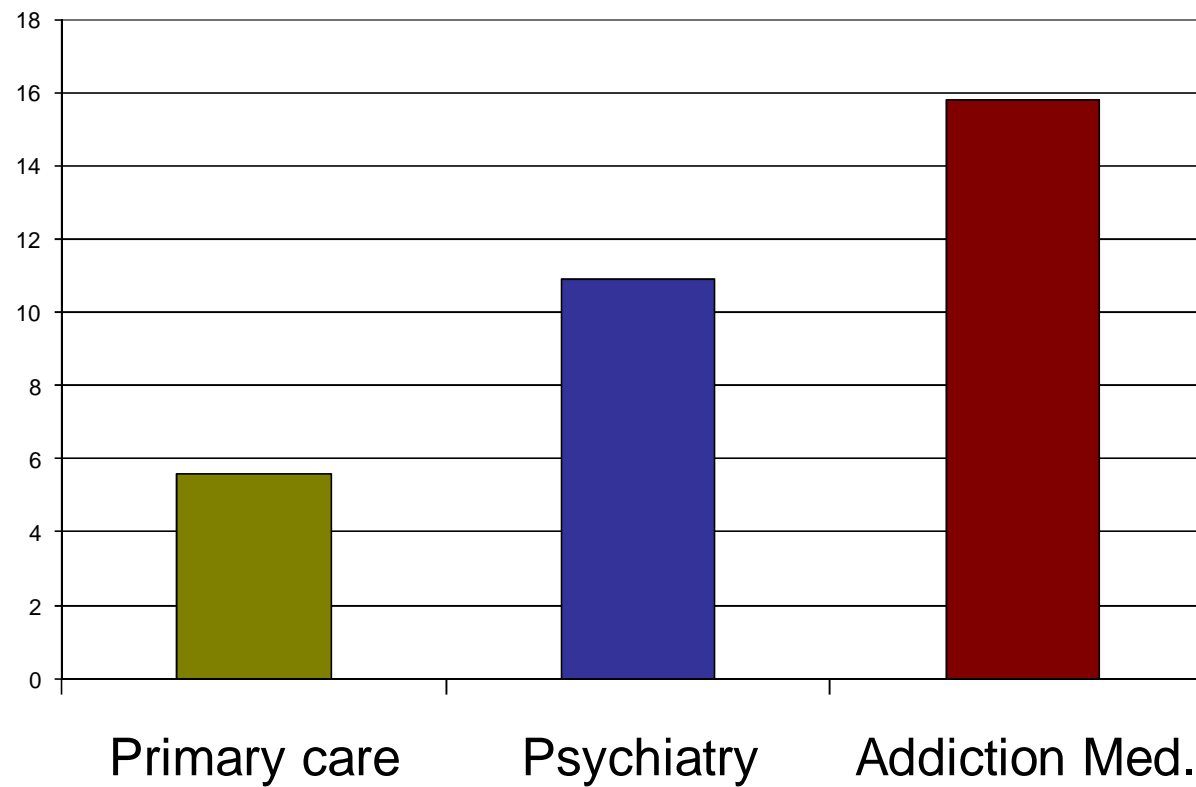

# Results

Discrimination between use and abuse and  
between abuse and dependence by ROC analysis

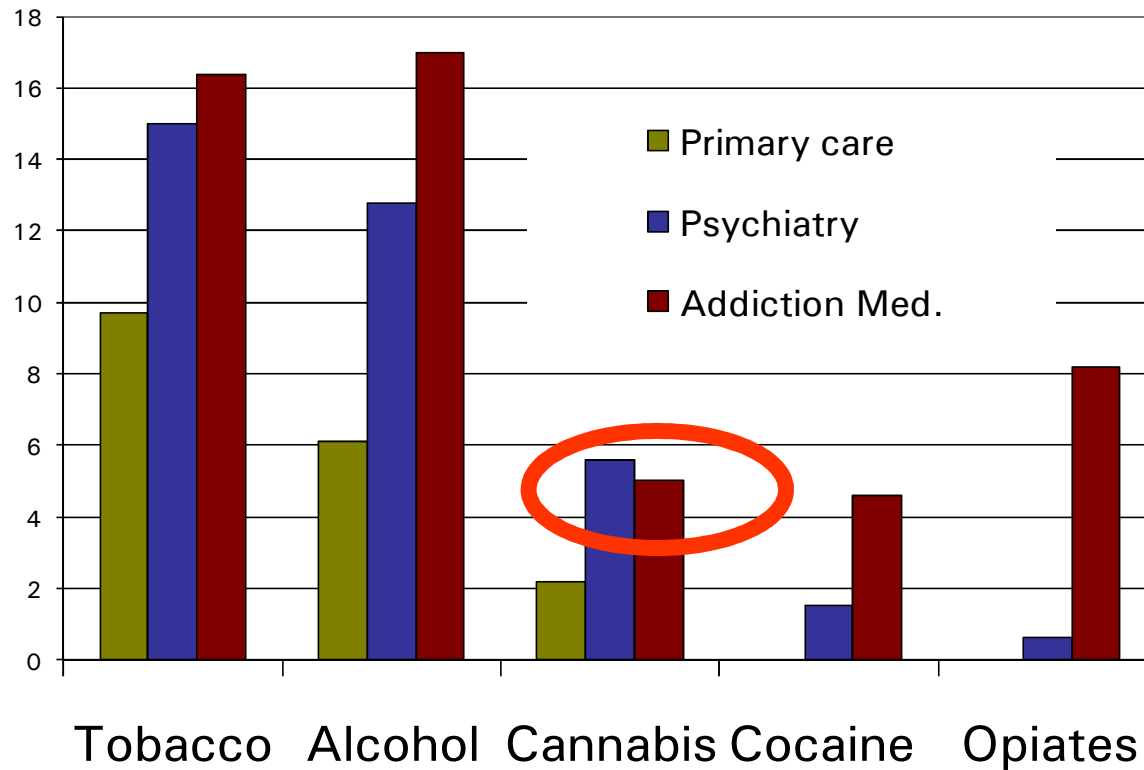

Domain	AUC	p-value	Sensitivity %	Specificity %	Cut-off
3B:SSI score for alcohol Use/abuse	0.74	p = 0,002	50	89	11.5
Abuse/dependence	0.87	p < 0,005	65	100	24.5
3C:SSI score for cannabis Use/abuse	0,98	p < 0,0005	100	88	2.5
Abuse/dependence	0,76	p = 0,06	70	71	17.5

**AUC:** area under curve, **SSI:** substance specific involvement, **na:** data not available

# AUDIT

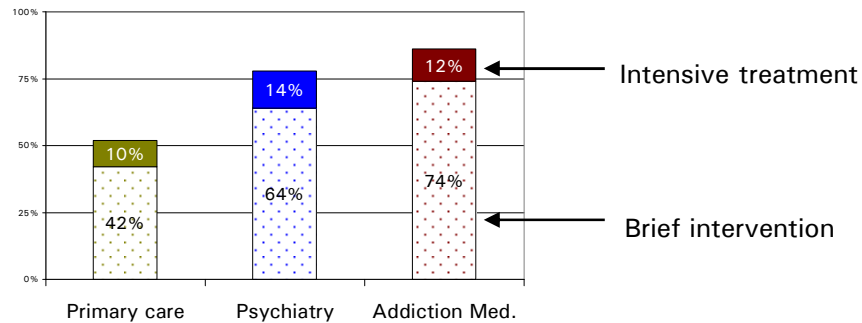

## ASSIST Scores in different settings

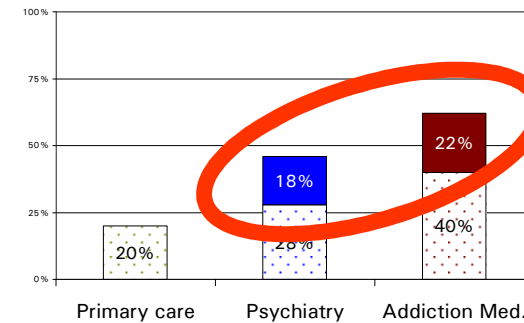

# Treatment Recommendations

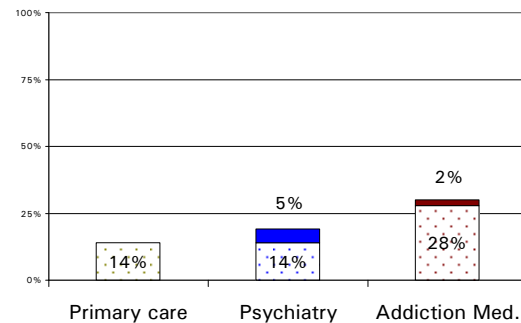

## Tobacco

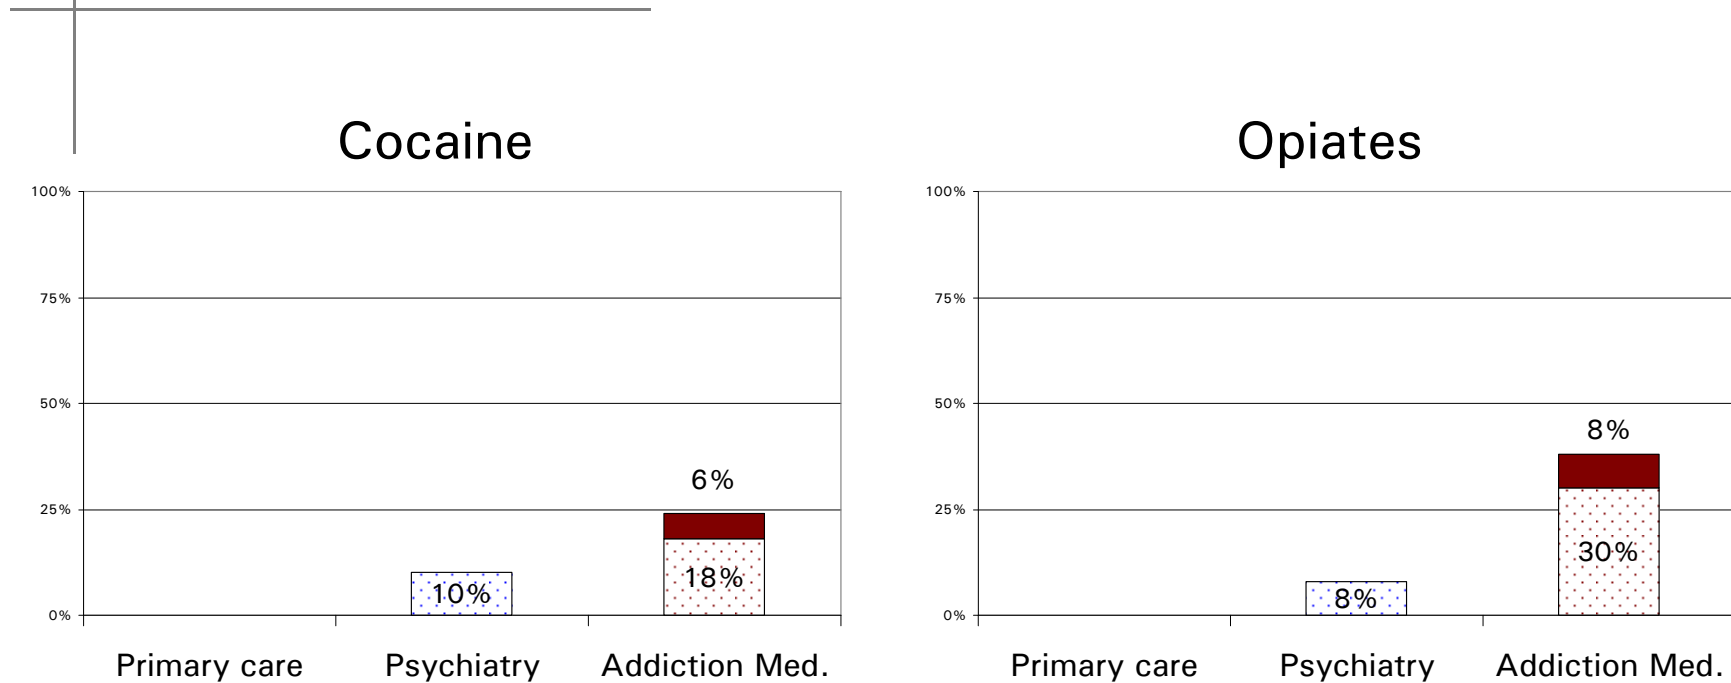

## Alcohol

## Cannabis

# Treatment Recommendations

# Study Limitations

- Small sample size
- Rarity of substance use disorders such as inhalants
- No calculation of sensitivity and specificity for several substances
- Cross sectional nature does not allow for predictive value

# Conclusion

- French version ASSIST an acceptable and valid screening test in an adult population, including psychiatric settings.
- The findings are convergent with the previous works on validity of the ASSIST
- Moderate correlation with RTQ probably due to ASSIST being a behavioural measure of addiction RTQ more a measure of somatic aspects of nicotine dependence.

# Conclusion

- In all settings brief intervention was the most frequently proposed indication to treatment
- Alcohol abuse, more intensive treatments were proposed in around 20% of patients in psychiatry and addictology
- What is the most effective approach in these populations is to be demonstrated (phase 3)
