

Fig. Intra-operative arterial hypotension. Data are from 5 dose-finding (○) and 11 single dose studies (□). The horizontal line represents equality. Vertical lines are 95% confidence intervals (CI). Symbols above the line of equality indicate that there are more episodes of intra-operative arterial hypotension with clonidine compared with placebo; when the 95%CI does not cross the line of equality, the difference is statistically significant. RR = relative risk. Test for heterogeneity of RR: $\chi^2=26.6$ df(21), $P=0.19$. The diamond represents the combined estimate of the RR (fixed effect).
