

# Les techniques invasives et minimalement invasives dans le staging du cancer bronchopulmonaire

V. Ninane, Hôpital Saint-Pierre,  
Bruxelles, Belgique

# Invasive Mediastinal Staging

- Purpose : to exclude
  - Involvement of mediastinal **contralateral side**
  - Extensive** involvement of the **ipsilateral side**  
→ medical management
- **Before PET introduction**
  - Nearly all cases (low performance of CT scan)
  - Or enlarged lymph nodes on CT scan
- **After PET introduction**
  - Positive hot spots (inflammatory processes)
  - Additional situations (PET + N1 tumors, mediastinal lymph nodes > 16 mm on CT scan, low SUV tumors, central tumors)

# Survival prognostic factors for N2 disease

## ● Favourable

- Complete resection
- One-level metastasis
- cN0-N1
- T1-T2N2
- Intranodal microscopic metastasis
- Without subcarinal nodal involvement
- T < 20 mm

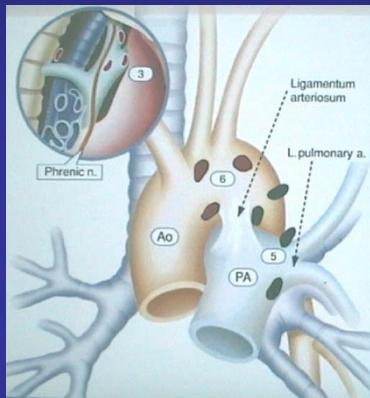

## ● Unfavourable

- Incomplete resection
- Multi-level metastasis
- Radiological N2 disease
- T3-T4N2
- Extranodal expansion
- Number
- Subcarinal node involvement
- T > 50 mm

# Invasive Mediastinal Staging

- Purpose : to exclude
  - Involvement of mediastinal **contralateral side**
  - Extensive** involvement of the **ipsilateral side**  
→ medical management
- **Before PET introduction**
  - Nearly all cases (low performance of CT scan)
  - Or enlarged lymph nodes on CT scan
- **After PET introduction**
  - Positive hot spots in N2/N3 zones (inflammatory processes)
  - Additional situations (PET + N1 tumors, mediastinal lymph nodes > 16 mm on CT scan, low SUV tumors, central tumors)

# Surgical mediastinal staging procedures

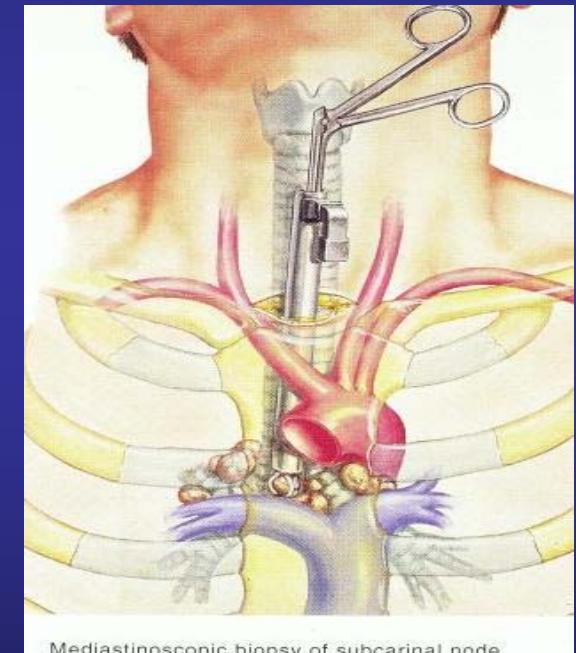

**Cervical mediastinoscopy**  
(+/- extended mediastinoscopy)

**Anterior mediastinotomy**  
(Chamberlain)

**Video-mediastinoscopy**

**Thoracoscopic staging**

# Cervical mediastinoscopy

- Usually under general anesthesia
- Morbidity (2%) and mortality (0.08%)
- Stations 2R,2L,4R,4L, anterior 7, pretracheal 1 and 3
- Videamediastinoscopy
  - Better visualization
  - More extensive sampling (including posterior 7), even complete dissection
  - Improvement in sensitivity and false negative rates

# Accuracy of standard cervical mediastinoscopic biopsies in LC

Source	Years	No of patients	Sensitivity %	Specificity %	FP %	FN %	Prevalence %
19 papers	83-03	6505	78	100	0	11	39

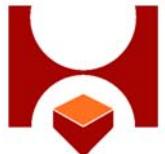

# Cervical Mediastinoscopy in LC patients

Studies	Patients Nb	Patient type	Sensitivity, %	Specificity, %	FP %	FN %	Prevalence
12	5118	c I-III	82	100	0	10	38

ASCO 2003

NICE 2005

ACCP 2007

Mediastinal  
sampling if  
enlarged LN (> 1  
cm)

- Extensive infiltration: TTNA or EUS-NA or TBNA
- CT enlarged discrete LN : mediastinoscopy
- PET + LN : mediastinoscopy
- CT normal LN : mediastinoscopy
- PET – LN : mediastinoscopy

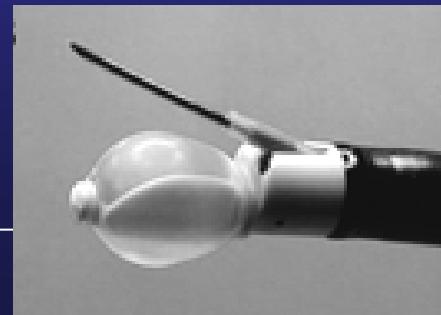

Biopsy if enlarged LN (>1cm) on CT  
(even PET -)  
Or PET + LN

Histo/cytological sampling if enlarged LN (>1cm) on CT  
Or PET + LN (PET - enlarged LN should not be controlled)

- Extensive infiltration : radiographic assessment
- CT enlarged discrete LN (PET + or -) : invasive or minimally invasive
- Central tumor or N1 : mediastinoscopy (needles 2nd choice)
- Peripheral stage I tumor and PET + mediastinum : mediastinoscopy (needles 2nd choice)

# Ultrasound puncture bronchoscope

- **Convex probe with a frequency of 7.5 MHz**
  - Linear transducer that scans parallel to the insertion direction of bronchoscope
  - Contact with/without balloon inflated with saline
- **Ultrasound scanner**
- **Doppler mode**
- **Bronchoscope** : outer diameter of 6.7 mm, direction of view is 30° toward oblique, channel diameter of 2.0 mm
- **Dedicated 22-gauge needle**

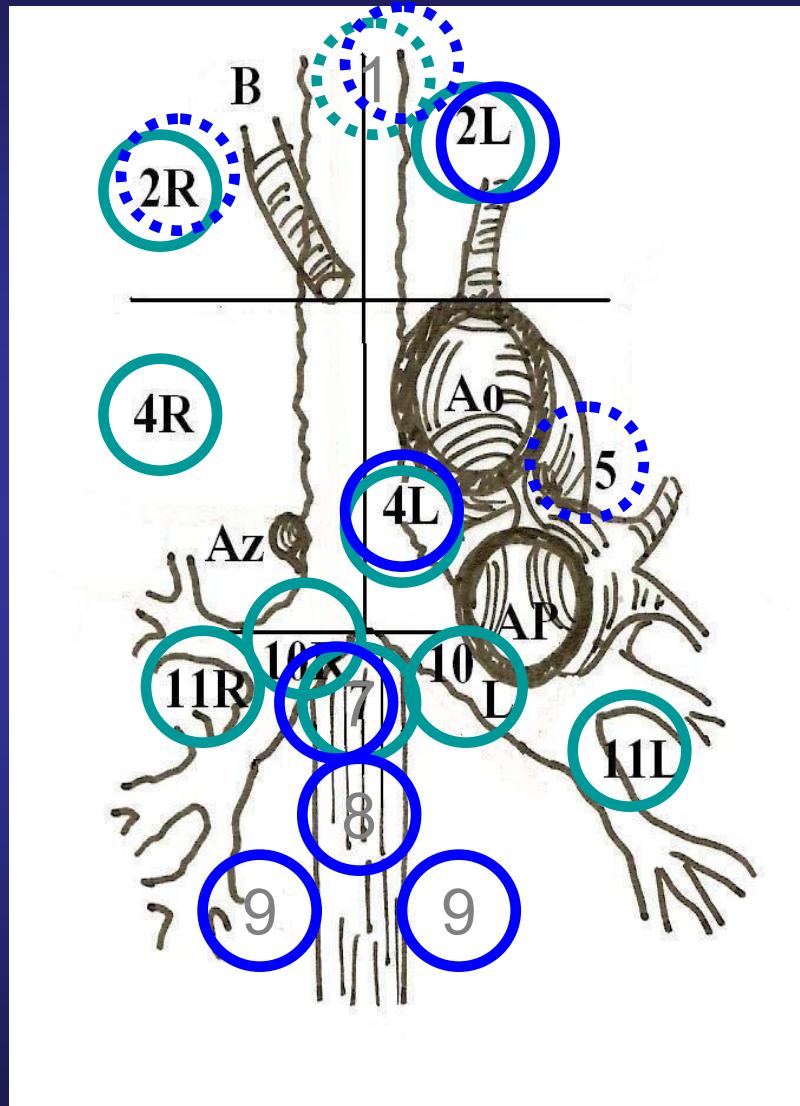

# EBUS-EUS

- Outpatient basis; 20-30 min
  - Conscious sedation (iv midazolam)
  - EBUS : anaesthesia of the airways
  - O<sub>2</sub> (2 L/min; nasal prongs)
  - Transcutaneous hemoglobin saturation and cardiac rhythm monitoring
- NB : EBUS under general anaesthesia in some centers

CHU St-Pierre | UMC St-Pieter

# EBUS-EUS complementarity

# Technical aspects EUS/EBUS

- **Standardized order of examination and sampling**

- **Examination** : from distally to proximally

- EUS : left adrenal gland and liver lobe
    - All accessible mediastinal lymph nodes
      - EBUS : also N1 stations in a diagnostic+staging strategy
      - Detection of lymph nodes down to a size of 2-3 mm
    - Shape, size, demarcation and echo pattern not accurate enough for distinction benign-malignant

- **Sampling** : because of the risk of contamination

- from N3 to N2 stations
    - Also
      - EUS : left adrenal gland
      - EBUS : N1 or the tumor at the end of the procedure, for diagnostic purpose only

# Technical aspects : sampling

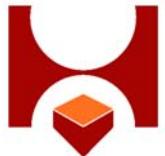

- Accessible lymph node for puncture : **short diameter  $\geq 5 \text{ mm}$**
- Optimal number of aspirations per lymph node station, if ROSE not used
  - EBUS-TBNA : **3**
  - EUS-FNA : **4**

# Technical aspects

- **Cytopathological specimens**
  - in some cases, tissue cores
- **Results** : positive (tumor cells), negative (lymphocytes or lymphoid tissue), inadequate (blood only, bronchial epithelial cells, cartilage)
- **ROSE** (rapid on-site sample evaluation)
  - Shortening the procedure

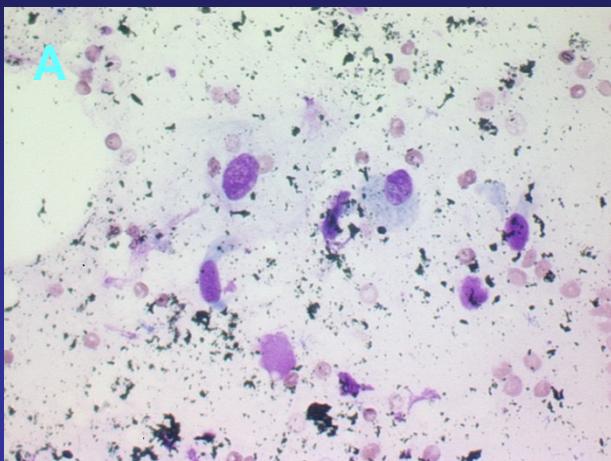

# EBUS-TBNA : Tolerance and Complications

- Tolerance under local anaesthesia
  - Cough is frequent (active smokers, open tracheostomy)
- Complications
  - Only mild bleeding
  - Pneumothorax (1/~500 examinations)
  - Low incidence of bacteremia ([Steinfort DP et al. Eur Respir J 2009, doi:10.1183/09031936.00151809](https://doi.org/10.1183/09031936.00151809)) and other infectious complications

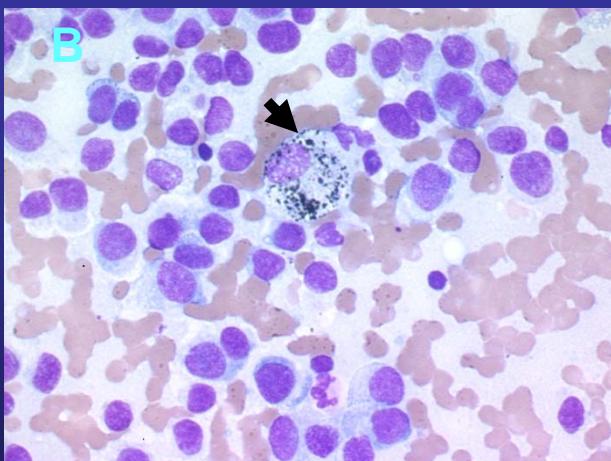

CHU St-Pierre | UMC St-Pieter

Mediastinal  
sampling if  
enlarged LN (> 1  
cm)

- Extensive infiltration: TTNA or EUS-NA or TBNA
- CT enlarged discrete LN : mediastinoscopy
- PET + LN : mediastinoscopy
- CT normal LN : mediastinoscopy
- PET – LN : mediastinoscopy

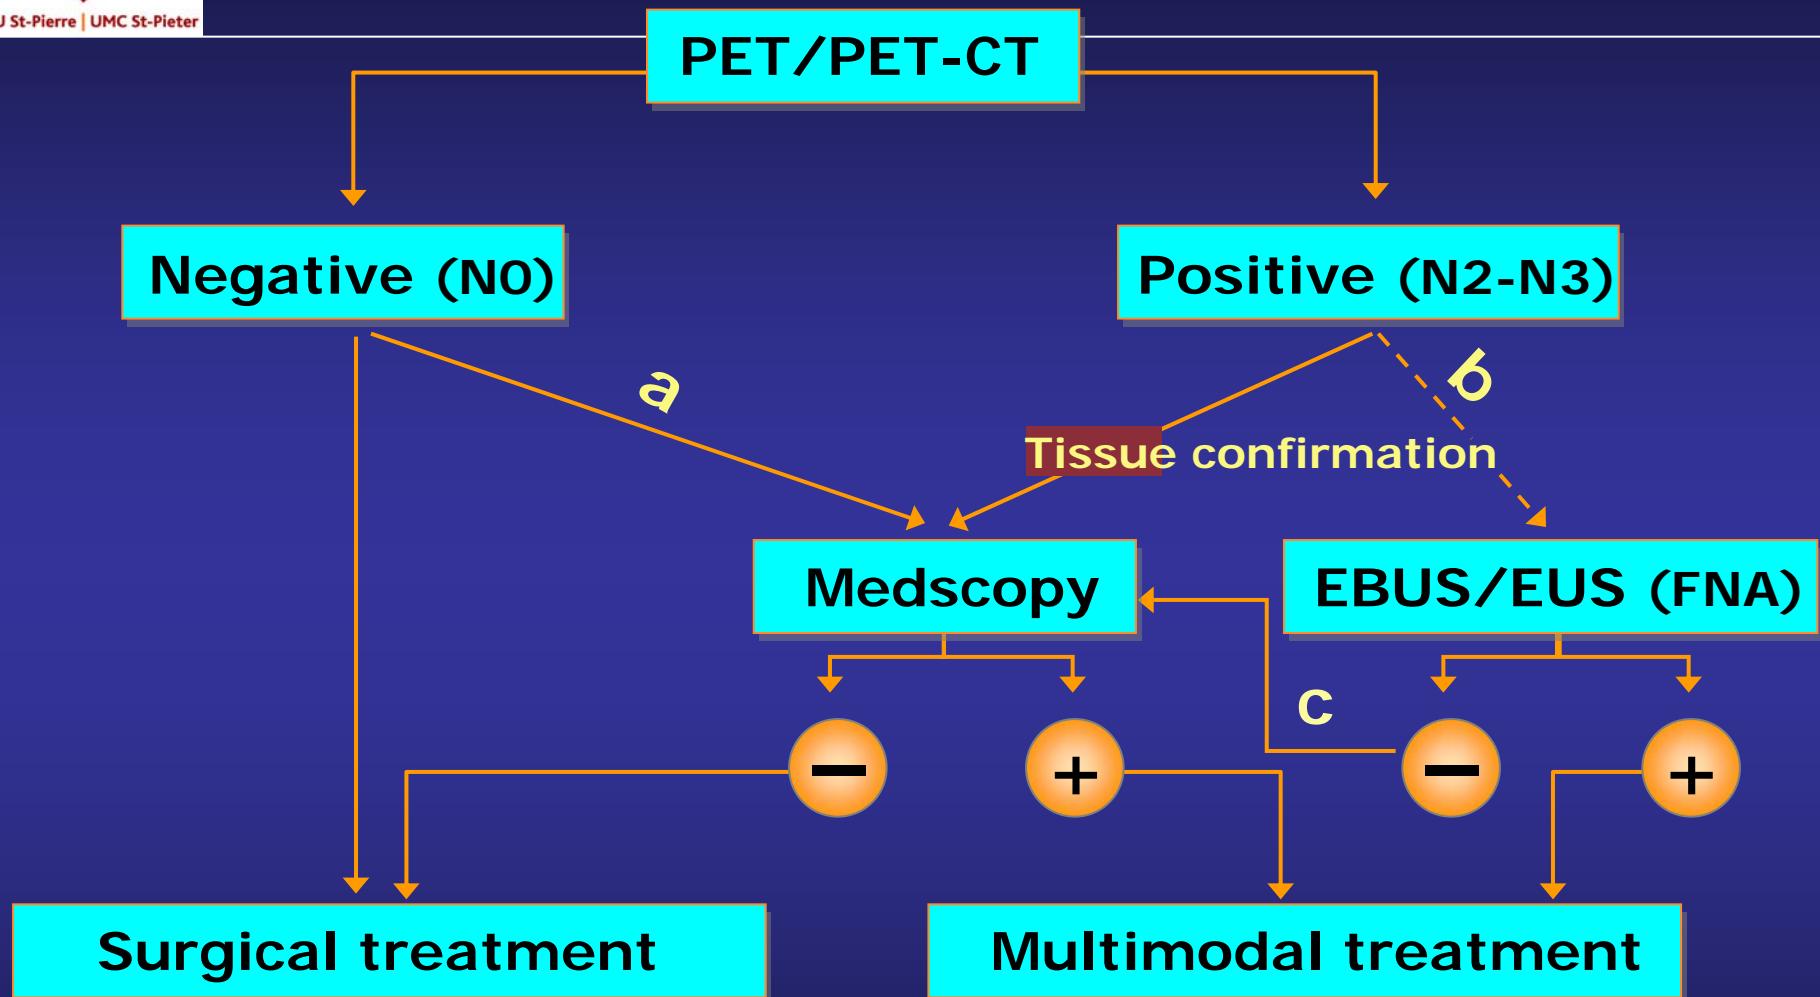

Biopsy if enlarged LN (>1cm) on CT  
(even PET -)  
Or PET + LN

Histo/cytological sampling if enlarged LN (>1cm) on CT  
Or PET + LN (PET - enlarged LN should not be controlled)

- Extensive infiltration : radiographic assessment
- CT enlarged discrete LN (PET + or -) : invasive or minimally invasive
- Central tumor or N1 : mediastinoscopy (needles 2nd choice)
- Peripheral stage I tumor and PET + mediastinum : mediastinoscopy (needles 2nd choice)

EBUS/EUS : minimally invasive procedure (a) but  
lower negative predictive value than mediastinoscopy (b)

a : PET N1 +; central tumors; low tumoral FDG uptake; LN size  $\geq 1.6$  cm

EBUS/EUS : minimally invasive procedure (b) but lower negative predictive value than Medscopy (c)

# Staging : Particular situations

- **Extensive infiltration of the mediastinum**
  - Radiographic assessment only (grade 2C ACCP 2007)
  - Invasive procedure sometimes required for diagnosis (blinded TBNA during the first bronchoscopy)
- **PET N1, Central tumor, Tumor with low SUV and with normal PET mediastinum**
  - Invasive staging required
  - EBUS-EUS not the first choice
    - Low prevalence of N2 and low NPV

# Radiographic groups with respect to intrathoracic radiographic characteristics

Group	Description	Definition
A	Mediastinal infiltration	Tumor mass within the mediastinum; LN cannot be distinguished or measured
B	Enlarged discrete mediastinal LN	LN $\geq 1$ cm (short axis on transversal CT)
C	Clinical stage II or central stage I	Normal mediastinal LN ( $<1$ cm) but enlarged N1 nodes or central tumor
D	Peripheral clinical stage I tumor	Normal mediastinal and N1 nodes and peripheral tumor

# EBUS-TBNA for mediastinal staging

Authors	Nb patients	Enrolment	Selection	Sensitivity (%)	Specificity (%)	Prevalence (%)
Krasnik 2003	11	ND	CT or PET +	100.0	100	90.9

# Impact on therapeutical strategy

- Prevent ~ 60-70 % of scheduled mediastinoscopies
- N upstaging, in comparison with mediastinoscopy alone
  - EUS + mediastinoscopy** improves staging and reduces the number of futile thoracotomies

Annema et al. JAMA 2005;294:931/Larsen SS et al. Lung Cancer 2005;49:377

–**Combined EBUS + EUS equal to or superior to mediastinoscopy ?**

# General conclusions : invasive mediastinal staging of NSCLC

- **Mediastinoscopy** is the gold standard
- **Initial staging**
  - EBUS and EUS are safe and accurate and will reduce the need for mediastinoscopy as well as cost
    - Indications : enlarged LN and/or FDG-PET positive LN
    - Combined EBUS and EUS may be a superior approach
- **Restaging** : the best combination (staging-restaging) needs to be assessed
